Intereses de la investigación

La investigación realizada por nuestro grupo de Electroquímica está orientada al diseño y caracterización de nuevos materiales electródicos, utilizados como sensores electroquímicos en la determinación de moléculas de interés medioambiental, tales como, fenoles, nitritos, nitratos, sulfitos y peróxido de hidrógeno. Dentro del desarrollo de los sensores electroquímicos se contempla como objetivo la aplicación de los sistemas a muestras reales provenientes de la industria, como por ejemplo, la de alimentos. Actualmente, estamos desarrollando estudios para generar electrodos sensores basados en materiales carbonosos, que combinado con el uso de líquidos iónicos, complejos de metales de transición y polímeros conductores, conforman nuevos materiales para desarrollar y validar nuevos métodos analíticos (Electroquímicos) en la detección de contaminantes medioambientales provenientes de distintas fuentes.
